

AI Ops Case Study 01 – Community Donation Outreach Automation

1. Background:

Two years ago, I founded a community outreach initiative called **Community Healing Zone** to take care of the homeless in my city through donations sourced through friends and family. Over time, it became clear that relying on personal networks alone wouldn't scale the impact we wanted. Churches felt like the natural next step for partnerships — but reaching out to them manually would take far too long.

Could AI increase outreach throughput without sacrificing personalization and quality?

2. Objective

The objective of this case study was to establish a manual outreach performance baseline, implement an AI-assisted workflow, and quantify the efficiency and throughput impact of automation.

3. Manual Baseline

Average Time per Lead: **7m 48s** (468 sec)

Leads per Hour: **7.69**

Manual process included website navigation, outreach signal extraction, contact identification, email personalization, and logging.

4. AI-Assisted Workflow

Average Time per Lead: **4m 13s** (253 sec)

Leads per Hour: **14.23**

AI was used to synthesize outreach signals and generate personalized introduction lines, reducing drafting and cognitive load.

5. Quantified Impact

Time Saved per Lead: **215 seconds**

Processing Time Reduction: **45.94%**

Throughput Increase: **84.98%**

Interpretation: AI reduced per-lead processing time by 45.94% and increased hourly outreach capacity by 84.98%.

6. Capacity Modeling (5-Hour Block)

Manual Output: 38.46 churches

AI-Assisted Output: 71.15 churches

Net Gain: **+32.69 churches**

Interpretation: AI assistance nearly doubled outreach capacity within a fixed time constraint.

7. Bottleneck Analysis & Next Phase

Primary remaining constraint identified: inconsistent website structures and missing outreach/staff pages, resulting in manual navigation friction.

Next optimization phase will focus on structured scraping, signal classification, and partial workflow automation.
