

AI Ops Case Study 01 – Executive Summary

Community Healing Zone Outreach Automation

Context

Two years ago, Community Healing Zone was founded as a grassroots outreach initiative distributing clothing and essential supplies to people in need. Donations began arriving faster than they could be distributed, creating a scaling challenge. Identifying and contacting partner organizations—especially churches—required manual research, qualification, and personalized outreach, which limited how quickly new partnerships could be formed.

Problem

The outreach process relied on manual research, website review, personalized email drafting, and logging. This workflow created a bottleneck: partnership growth was constrained by how quickly organizations could be researched and contacted.

Solution

An AI-assisted outreach workflow was introduced to accelerate research and personalization while maintaining human oversight. AI was used to extract outreach signals from organization websites and generate personalized email introductions. The operator reviewed and approved all outreach before sending.

Metric	Manual Baseline	AI-Assisted Workflow
Time per Lead	7m 48s	4m 13s
Leads per Hour	7.69	14.23

Measured Impact

- 45.94% reduction in processing time per lead
- 84.98% increase in outreach throughput
- Outreach capacity nearly doubled within the same 5-hour working window

Operational Insight

AI significantly reduced research and drafting friction while preserving human judgment. The new workflow demonstrates how human-in-the-loop AI can unlock meaningful operational leverage without sacrificing personalization quality.
